```

```
table(kuky_properties_df$Readability, kuky_properties_df$SyllogismBased)
```

```
##
##      false true
##   high    62  62
##   low     38   0
##   medium  48  11
```

```
kuky_properties_df %>% ggplot(aes(x = Readability, y = doclen)) +
  geom_boxplot()
```

Quick peek into other parts of the data set:

Subcorpus	Low # of chars	High # of chars
CzCDC/ConCo	2.000	18.000
CzCDC/SupAdmCo	3.000	30.000
CzCDC/SupCo	3.000	10.000
ESO	7.000	40.000
FrBo/articles	4.000	15.000

## Filter out duplicates

Some subcorpora overlap (*FrBo* with *ESO*, and multiple subcorpora with *KUKY*).

The usage of documents with `ClarityPursuit == NA` is questionable, let's exclude such documents. This effectively comes with a price of excluding the whole *ESO* subcorpus, even though some of its documents are available in *KUKY*.

The usage of documents with `ClarityPursuit == TRUE` is also questionable as they're not reviewed in the same manner as the documents from *KUKY*, yet at the same time they are less likely to be as "unreadable" as the documents with `ClarityPursuit == FALSE`. Such documents could very well be readable, interfering with the training process.

After filtering `ClarityPursuit == NA` out, the only remaining overlaps are with *KUKY*. Let's keep the documents from *KUKY* as they are associated with a more careful readability evaluation.

Additionally, there are 3 cases where a text is assessed for readability both by *KUKY* and by *FrBo*. In 2 of these cases, the assessments don't agree: the texts are assessed "low" in *KUKY*, but "medium" by *FrBo*. This doesn't matter **under the condition** that we put them both in the same class for the training (i.e., "bad"). Let's keep the observations from *KUKY* for simplicity.
